Aggregation pipelines
Firestore MySQL DynamoDB

Real-time, payments & AI

LiveKit WebRTC rooms
FCM push Stripe Razorpay
PayPal Gemini Embeddings

AI-assisted development

SUMMARY

Full-stack engineer with 8+ years of experience, strongest on the backend with Node.js and MongoDB. At Touch-A-Life I build and run a family of connected nonprofit platforms: TALGiving crowdfunding with Stripe, Razorpay and PayPal payments, LiveKit live-audio rooms, telehealth, and blood donation. I've shipped AI features with Gemini, rebuilt authentication for security (RS256, refresh-token rotation, session revocation), and I ship end to end, from API design and data modelling to Next.js and Flutter clients and CI/CD. The platform runs mainly on GCP, plus our own Ubuntu servers. I use Claude Code daily as an AI pair programmer for building, debugging, tests and reviews.

KEY ACHIEVEMENTS

Rebuilt authentication for 15 apps

After a penetration test, moved JWT signing from HS256 to RS256 with no downtime by accepting both during a migration window. Added refresh-token rotation, instant session revocation and device tracking for every TAL app. Cross-domain single sign-on is the next step.

Built live audio rooms from scratch

Took TALRadio Clubs from idea to production on LiveKit for web and Flutter, with moderation, polls, chat, per-speaker recording and AI transcription that detects each speaker's language.

Made pages load faster on slow networks

Removed about 135 KB of JavaScript from every TALBloodAid page, loaded maps and Firebase only when needed, and fixed server-rendering bugs that were hurting search rankings.

Moved money safely across 3 gateways

Built the TALGiving crowdfunding payment flows on Stripe, Razorpay and PayPal, with verified webhooks, withdrawals, payouts, balance calculation and reconciliation reports.

EXPERIENCE

Solix Technologies · Touch-A-Life Foundation

11/2022 – Present

Full-Stack Developer · Hyderabad

Lead contributor to the Touch-A-Life platform, a group of about 15 nonprofit apps that share one Node.js + MongoDB backend on GCP and our own Ubuntu servers. I own features end to end across backend APIs, Next.js web apps, React admin dashboards and a Flutter mobile app, and manage sprint-based releases to production.

Touch-A-Life core platform

Node.js · Express 5 · MongoDB · Firebase Functions · Stripe

- Build and maintain a service-oriented API: 700+ routes over 126 data models, split into 9 separately deployed services (auth, users, orgs, payments, donations, admin, media, health, app) plus a Cloud Tasks worker.
- Rebuilt authentication after a penetration test: moved JWTs from HS256 to RS256 with no downtime, added refresh-token rotation with a grace window, immediate session revocation and device tracking for all TAL apps. Cross-domain SSO is in progress.
- Built the TALGiving crowdfunding payment flows on Stripe, Razorpay and PayPal: verified webhooks, withdrawals and payouts, available-balance calculation, reconciliation reports and a two-step organization approval.
- Added AI-assisted donation recommendations that combine semantic ranking with a relevance weight score, and a Gemini translation provider.
- Standardized error codes across every API, added remote log-level control through Firestore, and moved all services to the asia-south1 region to cut latency for Indian users.
- Deploy mainly on Google Cloud (Firebase Functions, Cloud Tasks, Storage), and run additional services on our own Ubuntu servers.
- Built modules for clubs, events, pitch fest (judges and mentors), NGO volunteers and projects, WhatsApp, SMS and email notifications, and MongoDB text-index search.

AWARDS

On the Spot Award, Star Team Award, Service & Commitment Award

TALRadio: live audio clubs LiveKit · Next.js · TypeScript · Flutter

- Built a live audio "Clubs & Spaces" product for web and mobile: hosting, stage and speaker requests, host approval, moderation, mute-all, reactions, polls, and threaded chat with replies and edits.
- Record each speaker separately with LiveKit Egress, then run AI transcription that detects each speaker's language and falls back gracefully when a step fails.
- Added passwordless OTP login, club reminders and calendar invites, and automated daily and monthly listener and playlist reports sent by email.

TALBloodAid: blood donation network Next.js · MUI · Redux · FCM · Razorpay

- Improved performance and SEO on slow mobile networks: removed about 135 KB of JavaScript from every page, lazy-loaded maps and Firebase, and fixed SSR blank pages, soft 404s and hydration errors.
- Built a live donor-coverage map, push notifications, and resumable direct uploads for large videos with progress tracking.
- Added AI gallery search with embeddings whose model can be switched through configuration, and structured request logging with trace context.

TALGiving, TALHospitals & TALYouth React · Vite · Tailwind · Next.js

- Built the admin side of TALGiving, our crowdfunding platform: a React dashboard with a role hierarchy, approval queues for fundraisers, organizations and withdrawals, and AI search; split its APIs out of the core monolith into their own service.
- Built TALHospitals telehealth APIs (consultations, prescriptions, Google Meet scheduling) and CAPTCHA-protected password recovery.
- Built the TALYouth Next.js app: Google One Tap sign-in, a registration wizard for events, a club directory and global search.

Sonata Software

06/2021 – 10/2022

Developer · Hyderabad

Cost Calculator 02/2022 – 10/2022 · Node.js · React · Kafka

- Built the Node.js API layer for a web portal that estimates product cost, fetching product information and running the pricing calculations.
- Streamed product and pricing data between services with Kafka producers and consumers.
- Built reusable React functional micro-components that other teams used across the portal.
- Worked in Agile sprints with Jira, taking features from requirement to release with QA and product teams.

ArtWorks 06/2021 – 03/2022 · TypeScript · Node.js · Jest · Kafka

- Reviewed the existing legacy services and rewrote them as TypeScript Node.js services.
- Helped plan and carry out the team's migration from the old stack to Node.js, keeping the old and new services running side by side until cutover.
- Wrote Jest unit tests for the new services and documented the APIs with Swagger.
- Built data-processing jobs with kafka-node.

Tata Consultancy Services

03/2018 – 06/2021

Developer Associate · Thane, Maharashtra

Global Service Delivery Platform Node.js · AWS · MySQL · Splunk · React

- Built Node.js REST APIs (Express, aws-sdk, mysql) for a connected-vehicle mobile app used by customers across global regions.
- Built and ran serverless services on AWS: Lambda, API Gateway, S3, DynamoDB, SNS, Kinesis, EC2, and CloudWatch Logs and Insights.
- Wrote and tuned complex MySQL queries for vehicle and user data, and optimized existing code during integration.
- Sent AWS logs and metrics to Splunk and built dashboards that helped the team find and fix production issues faster.
- Ran integration testing before each release and handled code integration across teams.
- Owned production support: triaged and routed incidents in ServiceNow, fixed bugs and shipped enhancements, and worked directly with the customer to resolve application issues.
- Supported and fixed the React.js web pages that went with the app.
